handling materials and substances which are

hazardous to water

Federal Environmental Agency Federal Republic of Germany

No. 3

In-plant Pipeline Safety

Recommendations of the International River Basin commission for inplant pipeline safety

- 1 Pipelines must enclose substances hazardous to water in a safe manner.
- Pipelines must be adequately dimensioned in accordance with the physico-chemical properties of the substances being handled. The tightness of pipelines must be demonstrated by means of generally recognised testing method.
- Pipelines must be able to withstand mechanical, thermal, chemical and biological stress in accordance to the purpose of use and must be durable. This applies also to detachable connections (flanges or similar connections), pumps and other fittings.
- 4 Drifting and declivity of the pipelines must not endanger their safety and tightness.
- 5 Pipelines must be adequately protected against mechanical damages, e.g. being bumped by vehicles.
- Werification of tightness and resistance to corrosion should be subject to repeated checks by independent experts.
- Proof is required that the rate of attrition between the verification intervals does not result in any inadmissible weakening of the pipelines and in particular that localised corrosion is ruled out.
- Where the material of the pipelines is itself not sufficiently tight, suitable coatings are to be applied or equivalent safety measures should be taken.
- 9 Safety aspects must be taken into account when installing pipelines (underground/above-ground).
- Special safety measures are to be taken for pipelines in which the substances transported can cause electrostatic charges.
- 11 Underground pipelines, any detachable connections and valves should be installed in a monitored leak proof inspection shafts. The technical construction of such pipelines should comply with one of the following requirements:
 - they must have double-wall, any leaks in the pipeline wall must be indicated by an approved automatic leak indicator, or

Checklist no. 3: In-plant Pipeline Safety

- Page 3 of 21
- they must be designed as suction lines in which the liquid column is interrupted in the event of leaks, or precautions against the discharge of transported products must be taken in regular intervals, or
- They must be equipped with a suitable protective pipe or be laid in a conduit; any escaping substances must be visible in a monitoring device.

If, for safety reasons, none of these requirements can be fulfilled, only equivalent safety measures may be taken.

- Design, installation, inspection, maintenance of and alterations to the pipelines must be executed and documented professionally.
- 13 Pipelines must be labelled appropriately.
- 14 The position and layout of the pipelines must be documented.

Checklist no. 3: In-plant Pipeline Safety	Page 7 of 21
Examples of actions:	
 Short-term measures: Testing of special pipe fittings (T'-joints, connecting sleeves) or specific valves regard to the required design pressure. Ultrasonic scanning of the walls of selected pipe fittings to ascertain the availate thickness (random test) and calculation of the adequate wall thickness. 	· ·

Medium-term measures:

• Pressure and tightness tests to demonstrate that the pipes are tight.

Test medium: Water.

Test pressure: 1.3 x maximum operating overpressure of the pipe.

Test medium: Nitrogen or air (precautionary measures are necessary).

Test pressure: 1.1 x maximum operating overpressure of the pipe.

• If the test can not be performed for safety reasons: Non-destructive tests, e.g. measuring of the wall thickness with ultrasonic method at representative sections of the pipeline could be an alternative.

Determination of the real risk						
Is the sub-point of the recommendation implemented?						
Yes □ RC=1	Partially ☐ RC=5	No □ RC=10				
3 Suitability and durability						
3.1 In regard to the purpose to water-polluting substances and	hey are intended for, are the pip I durable to:	pes adequately resistant to				
a) Mechanical stresses?						
☐ Yes	☐ No	☐ Not applicable				
b) Thermal stresses?						
☐ Yes	☐ No	☐ Not applicable				
c) Chemical stresses?						
☐ Yes	☐ No	☐ Not applicable				
d) Biological stresses?

Checklist no. 3:	In-plant Pipeline Safety		Page 8 of 21
☐ Yes	☐ No	☐ Not app	olicable
☐ Action	☐ No action		
Remarks:			

Examples of actions:

Short-term measures:

- Testing of special pipe fittings (T'-joints, connecting sleeves, sealing) or specific valves and fittings with regard to the required design pressure.
- Ultrasonic scanning of the walls of selected pipe fittings to ascertain the available wall thickness (random test) and calculation of the adequate wall thickness.
- Visual inspection of the inner walling of selected pipe sections (e.g. by dismantling a fitting).
- Checking of available pipe documentation.

Medium-term measures:

• Pressure and tightness tests.

Test medium: Water.

Test pressure: 1.3 x maximum operating overpressure of the pipe.

Test medium: Nitrogen or air (precautionary measures are necessary).

Test pressure: 1.1 x maximum operating overpressure of the pipe.

• If the test can not be performed for safety reasons: Non-destructive tests, e.g. measuring of the wall thickness with ultrasonic method at representative sections of the pipeline could be an alternative.

Long-term measures:

- Record the suitability and resistance of all pipes based on the results of the test and positive operating experience in the pipeline documentation.
- New installations: A demonstration of the suitability and resistance should be performed by the installer or manufacturer prior to the installation.
