No. 10
Internal Alarm and
Hazard Control Planning

Recommendations of the International River Basin commission for internal alarm and hazard control planning

The internal alarm and hazard control planning (BAGAP) belong to one of the basic responsibilities of operators of Accident-prone plants. This should include the type and procedure of planned organisational and technical measures after detecting a hazardous situation which can lead to an accident or that can be caused by an accident that has already occurred.

- The internal alarm and hazard control plan must guarantee the rapid report of hazards to the internal and/or external organ designated to receive such reports immediately.
- 2 The internal alarm plan and hazard control plan must contain precise instructions related to specific plants and / or groups of plants for those persons or groups of persons in charge of passing on all messages in emergency cases
- Depending on the scope of the anticipated impacts, different alert levels must be fixed in agreement with the authorities responsible for disaster control. For such situations various co-ordinated alarm procedures are needed (e.g. Rhine warning and alarm system).
- The plant operator must specify in jointly with the authorities who is responsible for which measures in the event of an industrial accident.
- For the internal alarm and hazard control plan it is necessary to specify the persons in charge, their functions and responsibilities, their availability, meeting points and tasks for special squads of the emergency team. In addition, special experts must be listed by names and a schedule for their assignment specified.
- Specify the method of warning and alarming of the water users affected by an industrial accident as well as informing the public.
- For plant-related hazard prevention plan, the following general information are amongst others necessary:
 - Listing of available emergency resources
 - A description of the waters in the vicinity of the installation and any special uses (e.g. drinking water protection area)
 - Nature and quantity of substances in the fire sector and storage facilities of the plants, including safety data sheets and as the case may be, also in-house information on the substance

- 8 For every plant site or unit where there is high danger risk in case of accidental release of substances hazardous to water, the following information must be provided:
 - Fire brigade plans (highly dangerous areas, permitted fire fighting means etc.)
 - Water supply (e.g. fire-fighting water, availability of cooling water)
 - Power supply (e.g. emergency power supply, voltage switch)
 - Drainage plans (e.g. shut-off devices, containment facilities and highly dangerous areas)
 - In-plant alarm and warning equipment
 - Emergency shut-down of hazardous installations (e.g. reactors).
- 9 The main emphasis when specifying hazard control plans must be on the relevant substances hazardous to water and relevant dangerous technical facilities. The crucial factors here are:
 - Nature and quantity of potentially hazardous substances and their effects,
 - Dispersion behaviour of substances, possibilities of managing the damage, further possible consequences
 - Nature of installation
- Description of the industrial accident scenarios and the corresponding consideration of the impacts of accidental release of substances hazardous to water into surface waters (in terms of how long it takes for it to spread and how far it could spread).
- Description of measures to limit the effects of industrial accidents (e.g. facilities for containing fire fighting water, collecting tanks, fire fighting systems) on the basis of the relevant industrial accident scenarios such as
 - Leakage
 - Overfilling
 - Total failure of vessels, containers, pipelines or other portion of the plant
 - Fire outbreak and the amount of water needed to combat the fire
 - Accidents during in-house transportation of hazardous goods.
- 12 Training in regular intervals on how to respond and the measures to be taken in the event of industrial accidents.

- 13 Update the internal alarm and hazard control plans regularly.
- 14 Ensure that the local authority and the personnel are informed about the alarm and hazard control plans.

Checklist for monitoring the implementation of the recommendations

1	Alarm planning and alarm procedures							
1.1	.1 Can the danger alarm be reported to an internal organ immediately?							
	Yes		No		Not applicable			
	Action		No action					
1.2	Is it possible to report the	aları	m to an external authority im	med	iately?			
	Yes		No		Not applicable			
	Action		No action					
1.3			sed to pass on the informatio	n as	well as order the			
ımıþ	elementation of necessary ha	Zaru	I control measures?					
	Yes		No		Not applicable			
- is	this organ well equipped for	this	task?					
			n the appendix of <u>"Checklist for</u> communicated to external autho		ure in the normal			
ΠY	'es		No		Not applicable			
	Action		No action					
Ren	marks:							
Exa	amples of actions:							
Sho	ort-term measures:							
	Name an internal hazard response unit and specify the responsibilities and tasks.							
	 Instruct the personnel on the hazard reporting procedures. Install additional internal alarm systems such as alarming devices for emergency signals

Revision: 04

(sirens, alarm signalling lamps, telephones, and courier).

Checklist no. 10: Internal Alarm and Hazard Control Planning

Page 6 of 23

- Name the responsible partners from the local authorities, e.g. the public fire brigade, police, local government, civil defence authority.
- Specify the external and the local authorities to which the alarm should be reported by the internal hazard response unit.
- Install and test systems for reporting alarms to the external authorities, e.g. radio-telephones.

Medium-term measures:

- Install all necessary technical infrastructures and specify organisational measures for the internal hazard response unit, e.g. central rooms and communication infrastructures.
- Prepare a complete list of external hazard prevention authorities.
- Training on hazard reporting procedures.

Determination of the real risk							
Is the sub-point of the recommendation implemented?							
Yes □ RC=1	Partially ☐ RC=5	No □ RC=10					
	ustrial plant and/or plant complex an contain specific instructions f urm in case of accidents?						
☐ Yes	□ No	■ Not applicable

☐ Action	☐ No action						
Remarks:							
Examples of actions:	Examples of actions:						

Checklist no. 10: Internal Alarm and Hazard Control Planning

Page 7 of 23

Short-term measures:

- Name the personnel responsible for reporting alarms in case of accidents.
- Define specific instructions for these personnel, e.g.:
 - To which in-house organ should the alarm be reported?
 - Which information should be contained in the alarm report?
 - What has happened (type of accident: release of substances, fire, explosion, Which substances have been released and which amount?)
 - When did the accident occurred?
 - Where did the accident occurred?
 - How did the accident happen?
 - Who and what is affected (injury to persons, material damage)?
- Formulate specific instructions which contain special features of the plant or plant complex, e.g.:
 - Type and special properties of the substances which could be released,
- Information on the location of the plant and where the plant is installed (outdoors or indoors).
 - Possible fire and explosion risks.

Medium-term measures:

Determination of the real risk

• Differentiated and detailed description of the necessary steps in the internal alarm and hazard prevention plans.

	Yes		No		Not applicable			
	Action		No action					
Rer	narks:							

Examples of actions:

Short-term measures:

- Establish contact with the authorities responsible for planning and organisation of hazard prevention.
- The alarm and hazard prevention plan should specify the authorities to be notified in case of an accident.
- Name the staff of the local authorities responsible including their duties and document it in the company's alarm and hazard prevention plan.
- The duties and responsibilities for hazard prevention should be specified and a company's staff responsible for this job should be named. The name of this staff should be made known to the local authorities.
- The means and method of communication should be specified and included in the company's alarm and hazard prevention plan.
- Clarify those measures for hazard prevention that can be ordered by the local authorities and document these measures in the company's alarm and hazard prevention plan.
- The additional measures to be taken by plant operator in case of accident should be specified in coordination with the local authorities. For example:

Checklist no. 10: Internal Alarm and Hazard Control Planning Page 10 of 23

- Informing the public,
- Safety measures in the direct vicinity of the company,
- Safe disposal of dangerous substances.

<u>Medium-term measures:</u>

• Varied and detailed description of the exchange of information and communication with the local authorities should be included in the alarm and hazard prevention plan.

Is the sub-point of the recommendation implemented?							
	No □ C=10

Internal Alarm and Hazard Control Planning

Page 11 of 23

Checklist no. 10:

Checklist no. 10: Internal Alarm and Hazard Control Planning Page 12 of 23

Examples of actions:

Short-term measures:

- Name the team leader and other personnel responsible for the organisation and execution of the hazard prevention measures.
- Instruct and train the team leader and the other personnel regarding their duties.
- Availability of specialists who may be required.
- Definition of meeting points within and outside the company's premises.
- Simplified assessment of the alarming time and the time needed to implement the measures.

Medium-term measures:

- Include a detailed description of the organisational structure and the duties for hazard prevention in the alarm and hazard prevention plan.
- Training.
